Is it possible to get the Torque Spec values in a program?
Is there any I/O holding those values?

Thank you for your help.
Cheers.

I never see a signal or a register that maps those values.
But just to understand (and of course if you can talk about this) you need those signals for doing what?

Thanks for the reply.
It's DX200.
I want to use torque values in the program to check how heavy the weight that robot picks is.

95devils You're a legend \$Px050 do the job
Thanks mate

What generation of controller? \$Px050 is axis torque.

Hi 95Devils,
do you have a complete list of the system variable?

*Hi 95Devils,
do you have a complete list of the system variable?*

Oh, how I wish. I read a lot of manuals.

Thanks aut8126,
I have those list and manual but it's partial (and for older version of DXxxx the \$PX050 doesn't appear, so I can't help you in the previous post).

P.S.
I think that posting manual is not allowed in the forum. Be careful 🙏

@Motouser: I guessed you may need more information as that manual is available online.
Thank you for informing me that (I removed it), I thought there would be no issue in posting that manual as I could also find it online.
